

# AppConfig helper

The `appconfiggenerator.py` is a small python script to generate appconfig payload based on the values defined in `appconfig.yaml`.

To customize the behaviour of your network, please open `appconfig.yaml` and set the values you wish for each sensor type.

## Installation

Please ensure you have Python >3.6 on your system with:

```
python --version
```

Install the requirements under your python environment with:

```
pip install -r requirements.txt
```

Once the installation of the dependencies is over, run the script with:

```
python app_config_generator.py
```
